

A sovereign PQC compliance appliance.

GRIDERA's compliance brain runs fully on OVHcloud iron — data never leaves customer-selected geography, inference stays on-prem, and every compliance event is anchored to Hedera HCS.

CISO PAIN POINTS WE HEARD

- US CLOUD Act / extraterritorial data access risk blocks SaaS adoption.
 - Regulators demand data residency, but legacy compliance tools run on US clouds.
 - AI-generated audit reports cannot be sent to public APIs or foreign infra.
 - PQC migration is fragmented across jurisdictions with no audit trail.
-
- GRIDERA AI reports run on Ollama/vLLM inside OVH Bare Metal or Hosted Private Cloud.
 - NIST PQC migration plans (ML-KEM-768 / ML-DSA-65) generated on sovereign iron.
 - HCS-anchored audit trail gives regulators replayable, geography-bound evidence.
 - Joint customer chooses datacenter region; OVH isolates US activities by design.

GRIDERA BRINGS

- 4-region PQC scanning + compliance engine
- On-prem LLM-powered audit reports (Ollama / vLLM)
- ML-DSA-65 signed HCS audit events
- EU AI Act / NIST FIPS 203-204-205 mapping

OVHCLOUD BRINGS

- Sovereign cloud with US activity isolation by design
- Bare Metal + Hosted Private Cloud across 46 datacenters
- Customer-chosen data location for residency compliance
- GPU-capable AI/ML infrastructure for local inference

JOINT PILOT PROPOSAL

1. Deploy GRIDERA on OVH Bare Metal in a Canadian/EU datacenter.
2. Run PQC migration + audit reports fully on-prem via Ollama/vLLM.
3. Anchor every compliance event to Hedera HCS with ML-DSA-65 signatures.
4. Co-publish case study: "Sovereign PQC Compliance Appliance."
